To Whom It May Concern:

Re: Global Mining Products

GBF Underground mining currently uses the pumps supplied by Global Mining Products for our underground pumping requirements.

Since the introduction of these pumps in December 2004 we have experienced a dramatic change in our pumping on site. This has resulted in substantial savings in pumps maintenance costs including reduced expenditure on parts, reduced down time, less frequent change outs and a reduction in man hours required to maintain our pumps.

With the introduction of both electric Global submersible and the Pumps 2000 double diaphragm air pumps, we have been able to realize a \$450,000.00 reduction in pump maintenance costs in the first six months of operation and with further management we will see a further reduction in costs.

I am confident that with the continued level of service provided by Global Mining Products we will be able to maintain a reliable fleet of pumps at a substantially reduced cost.

Please feel free to contact me to discuss any time.

Regards,

Tony Oehme
